

ImageAnt guide for color
pattern scoring of the
Eastern Red-backed
Salamander (*Plethodon*
cinereus)

Color pattern key

- Red striped morph:
 - Red or orange-red stripe running along the back
 - The stripe can be continuous or discontinuous (see “difficult striped morph” photos)
 - The sides are dark colored
 - Contrast in color between the stripe and sides
- Lead morph:
 - Uniformly black or dark gray on the back and sides
 - Can be speckled or not, but will never have large spots
 - Sometimes light shining can create a reddish-looking tinge – but still no clear contrast between back and sides (see “difficult lead morph” photo)
- Other:
 - Any aberrant color (not described above).
 - E.g., white stripe, uniformly orange or silver
